

Xsite excavator control systems – the right solution for every requirement

Limburg/Chelles, March 2015

The modular structure of MOBA's Xsite range of excavation systems offers the highest possible level of flexibility, providing you with a suitable solution for every project, whether it be small or large. The 2D system is an entry-level system that provides all the 2D functionalities for smaller projects. With the 2D/3D system, comprehensive 2D functionalities are available. This unit includes the largest touchscreen display available on the market for a 2D excavator control system. Another special feature is the option of upgrading to 3D at any time. Only the GNSS extension must be added to be able to work in 3D. By doing so, you can create simple 3D profiles directly on site. Measuring and checking work is largely eliminated thanks to the system's GNSS positioning functionality. Using the optional GNSS compass, the machine's orientation can now be seen. The high-end 3D system offers even more 3D functionalities: for example, 3D models can be read and used in all widely-available formats and without the need for tedious conversion processes. All data is saved for later documentation and its cable-free data exchange capacity allows fast transfer of information from office to construction site and vice versa. Using Xsite systems the machine operator can work with great precision even at construction sites with bad visibility and for underwater work. Where you have any questions, our remote support can provide you with help quickly and without complications. The modular structure of the systems allows it to be upgraded to any level within the Xsite range at any time.
